

1.Introducing Our Vision:

Our project is a **responsible alcohol consumption management website**. The main idea is to help people control their alcohol consumption by setting a **weekly limit**.

Users can log in, check their weekly limit, and track how much they have consumed. The website also provides **awareness about the effects of alcohol** on the body, mind, family, and daily life.

The main goal of our project is **not to promote alcohol**, but to encourage people to understand its effects and make more responsible choices.

2. User Login & Identity Verification

Users need to log in using their **Aadhaar number**.

An **OTP is sent to the mobile number linked with the Aadhaar** for verification.

The system verifies the user's identity and **checks their age**.

If the user is **under 18, access to the service is restricted**.

Only eligible users can continue to the next step.

This helps prevent **underage access** and provides a more secure and responsible system.

3. Legal restrictions

If a person is involved in a **drunk-driving case or another alcohol-related legal case**, the case can be recorded in the system (police station).

The person's **Aadhaar number can be linked to the legal case record**, subject to applicable privacy and legal requirements.

Based on a **valid legal restriction or court/authorized order**, the system can temporarily **block that person from purchasing alcohol**.

When the person tries to log in, the system checks their restriction status.

If an active restriction is found, the purchase request is **automatically blocked**.

This feature can help authorities **enforce legal restrictions and promote responsible alcohol consumption**.

4. Selection System

The system shows **nearby authorized shops** based on the user's location.

Users can select a shop that is convenient for them.

The selected shop displays the **available products**.

Users can view basic product details such as **name, category, and availability**.

The system checks the user's **weekly limit** before allowing the selection.

Users can select the required product and quantity and proceed to **confirmation**.

5. Time Slot System

Users can choose an **available time slot** to visit the selected shop.

The system displays the **available date and time slots**.

Once a slot is selected, it is **temporarily reserved for the user**.

Users receive a **confirmation of their selected time slot**.

The system helps reduce **crowding and waiting time** at shops.

If a slot is unavailable, users can choose **another available slot**.

6. Weekly Limit Management

The system sets a **weekly purchase limit** for each eligible user.

Users can view their **remaining weekly limit** on their account.

Every purchase is automatically **added to the user's weekly consumption**.

When the user reaches the limit, the system **blocks further purchases** for that week.

The limit is **reset at the beginning of the next week**.

This helps prevent **excessive purchasing** and encourages responsible consumption.

7. Purchase History & Tracking

The system keeps a record of the user's **previous purchases**.

Users can view their **purchase date, shop, product, and quantity**.

The system tracks the user's **weekly consumption** automatically.

Users can check how much of their **weekly limit has been used and how much remains**.

The purchase history helps identify **unusual or repeated purchasing patterns**.

This can help prevent users from **sharing or misusing their account to purchase products for another person**.

The system can help ensure that purchases are made **only by the verified account holder**.

8. Alcohol Awareness & Its Effects

The website provides **awareness about the effects of alcohol** on the body and mind.

It explains the possible effects of **regular and excessive alcohol consumption**.

Users can learn about the impact on **health, relationships, work, and daily life**.

The system can show the differences between **not drinking, occasional drinking, and frequent drinking**.

It also provides information about the risks of **drunk driving and alcohol-related accidents**.

The main goal is to **educate users and encourage responsible decisions**.

9. Admin access

The admin has **secure login access** to manage the system.

Admins can manage **users, shops, products and time slots**.

They can monitor **purchase records and user activity**.

If sometimes Admins can block accounts when there is a **valid restriction or violation**.

They can manage **legal restriction records** and apply authorized purchasing blocks.

Admins can also update **alcohol awareness and safety information**.

All important admin actions should be **recorded for security and accountability**.

10. Technology Behind Our Project

HTML – Used to create the structure of the website.

CSS – Used to design the layout, colors, and responsive interface.

JavaScript – Used for user interactions, validation, OTP flow, limits, and dynamic features.

Local storage – storing the data **temporarily**.

11. Our Future Vision & Conclusion

In the future, we can introduce a **single-device login system** to reduce account sharing.

One account can have **only one active login at a time**.

This can help prevent a person from giving their ID or account to someone else to purchase alcohol.

Every purchase will be recorded in the **verified user's purchase history**.

With proper **government approval and legal safeguards**, authorized access to purchase history could be provided when required.

This creates **accountability** because users know that purchases made through their ID will remain linked to their identity.

For example, if a person gives their ID to another person to purchase alcohol for them, the purchase will still appear under the original user's history.

This can discourage people from **misusing or sharing their accounts**, even when they are not personally consuming alcohol.

Our future vision is to build a system based on **identity, accountability, security, and responsible consumption**.
